⑤4 4-Piperidinealkanamine derivatives.

⑤7) Compounds of general formula I ($Z=O$) are prepared by reacting 4-piperidinealkanamines with carboxylic acids or reactive derivatives thereof, such as the esters of lower aliphatic alcohols or acid halides. Compounds of general formula I ($Z=CONH$) are likewise obtained by means of the reaction between 4-piperidinealkanamines and isocyanates.

The compounds of general formula I thus obtained, and the pharmaceutically acceptable salts thereof are of a great therapeutic utility, given their activity as specific antagonists of histamine H₁ receptors.

NEW 4-PIPERIDINEALCANAMINE DERIVATIVES

INTRODUCTION

Current availability of H_1 antihistamines without central effects has afforded great therapeutic progress, and has again promoted an increasingly greater interest in the development of new structures having this property. The enormous differences which exist as regards chemical structure, specific action, etc., in non-sedative H_1 antagonists render the search for structure-activity relationship difficult. It seems that, up to now, the fact that a molecule should have these two properties, both an antihistamine action and the inability to cross the hematoencephalic barrier, this latter property depending on its liposolubility, is purely a matter of chance.

Moreover, most classical H_1 antihistamines likewise present a serotonin antagonism, anticholinergic activity and a blocking of the α_1 adrenergic receptors, responsible for several side-effects linked to the main activity, which limits its own therapeutic action.

For this reason, the search for new antihistamine molecules is centered on the synthesis of a pure H_1 antagonist having a greater affinity for peripheral rather than central histamine receptors - this property being intensified if the drug has difficulty to cross the hematoencephalic barrier - and a small or null antagonist activity towards other biological amines.

Some 4-piperidinealcanamine derivatives have a marked activity as specific antagonists of the histamine H_1 receptors.

The present invention relates to the preparation of new 4-piperidinealcanamine derivatives which may be used successfully in the treatment of allergies.

It consists in reacting a reactive derivative of an alkylaryllic alkylheteroaryllic or heteroaryllic carboxylic acid, or the carboxylic acid itself, with a 4-piperidinealcanamine to form a carboxamide of general formula I ($Z = CO$) and the pharmacologically acceptable salts thereof.

When 4-piperidinealcanamine is reacted with an isocyanate, $R^3(CH_2)_mNCO$, a urea derivative of general formula I ($Z = CONH$), is formed.

The meanings of general formula I are as follows:

R^1 = alkyllic ($C_1 - C_4$), alicyclic ($C_5 - C_6$), alkylaryllic or alkylheteroaryllic organic radical, such as, for example, methyl, ethyl, isopropyl, cyclopentyl, cyclohexyl, 2-phenylethyl, phenylmethyl, 2-piperidinylmethyl, 3-piperidinylmethyl, 4-piperidinylmethyl, 4-phenyl-4-hydroxybutyl, etc., and the corresponding radicals substituted in the aromatic ring by CH_3 , C_2H_5 , $OH.OCH_3$, CF_3 , F , Cl , Br , I , NH_2 and NO_2 .

Z = carbonyl (CO) or carbonylamine ($CONH$) group.

R^2 = hydroxyl group (OH) or a hydrogen atom (H).

n = either 0, 1 or 2.

m = either 0, 1 or 2.

R^3 = aryllic, alkylaryllic, alkylheteroaryllic or heteroaryllic radical, which may in turn be substituted within the aromatic ring by CH_3 , C_2H_5 , OCH_3 , OCF_3 , OH , F , Cl , Br , I , NH_2 , NR^4R^5 , $COOH.COCH_3$, $NO_2(R^4R^5 = \text{acetyl, sulfonyl, } CH_3, H)$.

Thus there is obtained, for example: 4-chlorophenylmethyl, 4-methylphenylmethyl, 4-hydroxyphenylmethyl, 4-fluorophenylmethyl, 4-acetyloxyphenylmethyl, 4-methoxyphenylmethyl, 3-chlorophenylmethyl, 3-methylphenylmethyl, 3-hydroxyphenylmethyl, 3-fluorophenylmethyl, 3-acetyloxyphenylmethyl, 3-methoxyphenylmethyl, 2-chlorophenylmethyl, 2-methylphenylmethyl, 2-hydroxyphenylmethyl, 2-fluorophenylmethyl, 2-acetyloxyphenylmethyl, 2-methoxyphenylmethyl, 2-thiophenemethyl, 3-thiophenemethyl, 2-thiophene-ethenyl, 2-(3-thiophenyl)-ethenyl, 2-furanomethyl, 3-furanomethyl, 2-pyridyl-methyl, 3-pyridyl-methyl, 4-pyridyl-methyl, 2-phenyl-ethyl, 2-thiophenyl, 3-thiophenyl, 2-furanyl, 3-furanyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 4-hydroxyphenyl 2-thiazolyl, 5-thiazolyl, 2-(3-methyl)-thiophenyl, 2-(5-methyl)-thiophenyl, 2-(3-methoxy-5-methyl)-thiophenyl, 2-(3-methoxy-5-phenyl)-thiophenyl, 2-(3-methylsulfonylamine)-thiophenyl, 2-

(3-methylsulfonylaminoethyl)-thiophenyl, 5-(2,4-dimethyl)-thiazolyl, etc.

R^3 can also mean a cyclic or heterocyclic carbon radical, with more or less unsaturation, such as, for example: cyclohexyl, 1-cyclohexenyl, cyclopentyl, 1-cyclopentenyl, 2-tetrahydrothiophenyl, 2-tetrahydrothiophenyl-methyl, 2-tetrahydrofuranyl, etc.

5 The 4-piperidinalcanamines used in the present invention are compounds which are sufficiently described in the literature. Some of them, such as 1-(1-methylethyl)-4-piperidinamine, 1-methyl-4-hydroxy-4-aminomethyl-piperidine, 1-(3-pyridyl-methyl)-4-aminopiperidine, etc. are not described in the literature, but they may be prepared, with very high yields by the methods so described in the bibliography, such as, for example, N.H. Harper et al. (J. Med. Chem. 7(6), 729 (1964)), or G. Regnier (Chim. Ther. 3, 185 (1969)).
10 from easily obtained products, such as ethyl acrylate, isopropylamine, methylamine, 3-aminomethyl-piridine, etc., which are transformed into the corresponding N-substituted 4-piperidinones. The derivatives of 4-piperidinamines ($R^2 = H$) are obtained by reduction of its oximes. The reaction between the 4-piperidones and nitro-methane, which process is likewise described in the bibliography. G. Regnier (Chim. Ther. 174 (1969)) gives 4-hydroxy-4-nitromethyl-piperidines, which, on being reduced by Zn/H^+ (Belg. 818.471)
15 produce 4-hydroxy-4-aminomethylpiperidine ($R^2 = OH$) derivatives.

The reduction of 4-piperidinones with $NaBH_4$ and subsequent treatment of the 4-piperidinol obtained with p-toluensulfonyl and KOH results in 4-cyanopiperidines which are reduced with $LiAlH_4$ and to the corresponding 4-piperidine-methanamines, such as, for example, 1-(1-methyl ethyl)-4-piperidine-methanamine or 1-(2-phenylethyl)-4-piperidine-methanamine.

20 As regards the carboxylic acids used, and their reactive derivatives, these are products described in the bibliography. Thus, synthesis of 2-tetrahydrothiophenyl-acetic acid is effected by the method of Wrobel et al. (Synthesis, 452 (1987)) for obtaining 2-tetrahydrothiophene-carboxylic acid, and the subsequent Arndt-Eistart reaction to which it is subjected.

The aromatic or alkylarylic isocyanates used in the preparation of compounds of formula I ($Z = CONH$)
25 are obtained by means of the process described by H. Ulrich et al. (Synthesis, 277 (1979)).

The invention is performed, in practice, by reacting a carboxylic acid $R^3(CH_2)_mCOOH$ with a 4-piperidinalcanamine in the presence of a condensing agent such as N,N'-dicyclohexylcarbodiimide in a suitable inert solvent, such as tetrahydrofurane, dioxane, dimethylformamide or dimethylsulfoxide, at temperatures of between 20 and 60° C and in a period of from 1 to 24 hours.

30 The process can also be effected by reacting an acid chloride $R^3(CH_2)_mCOCl$ with a suitable 4-piperidinalcanamine in ethyl ether, chloroform, tetrahydrofurane, dichloromethane, dioxane or benzene at 20 to 60° C for 1 to 5 hours, to give the carboxamide chlorhydrate of general formula I.

A further variant of the invention consists in using an ester $R^3(CH_2)_mCOOR^6$ ($R^6 = Me, Et, MaOCH_2CH_2$, which is reacted with the 4-piperidinalcanamine in a solvent having a high boiling point, such as toluene, xylene, dimethylformamide, etc., at the boiling temperature thereof during 6 to 48 hours in the presence of suitable condensing agents, such as, for example, 4A molecular sieve, sodium ethoxide or 4-methyl-benzenesulfonic acid. The carboxamide formed is purified by crystallization in a suitable solvent, usually mixtures of EtOH, MeOH or isopropanol with H_2O .

40 Finally, the reaction between isocyanates $R^3(CH_2)_mNCO$ and 4-piperidinalcanamines takes place in an inert solvent such as ethyl acetate, toluene, ethyl ether or tetrahydrofurane, at temperatures of between 0 and 20° C and for a period of time of from 1 to 24 hours.
